

# CAVITY WALL INSULATION

## Cavity Wall Insulation Fact sheet

-  Myths - Years ago cavity wall insulation developed a bad name for causing damp, in most cases this was due to wrong materials being used, poor installations being carried out and in some cases defects on a property causing water egress. Now modern materials repel moisture instead of absorbing, allow air flow through the cavity and installations are far heavily monitored thanks to TrustMark.
-  Lower Energy bills - Cavity wall insulation is one of the most effective ways to reduce heat loss, in fact it can reduce heat loss by up to 30% reducing your properties heat demand therefore reducing your fuel bills.
-  Hassel free installation - Installations are now completed externally within a few hours, with fewer holes needed and with less disruption than ever before.
-  Increase EPC - Mortgage lenders and buyers are now looking at properties EPC to aid decisions to buy/lend. It's currently against the law to let a property if the EPC is below E, this is being moved to a minimum of D in 2025.
-  Warmer winters/Cooler summers - Its another big benefit that you may not know, having cavity wall done with the right material can not only retain the heat in the winter months, but can also stop radiating heat penetrating in the summer months much like a flask can keep liquids cold or hot.
